MEMBRIA.AI · PARTNERSHIPS

Build with the memory layer for *AI agents*.

We are looking for technology and infrastructure partners to bring persistent, auditable agent memory to more teams, clouds and data centres.

Michael Aprossine

CEO, Co-Founder — Membria.AI by Actiquest Labs

PARTNER DECK

2026 · v1.0

COMPANY

Who We Are

Actiquest Labs

Applied AI Systems Company

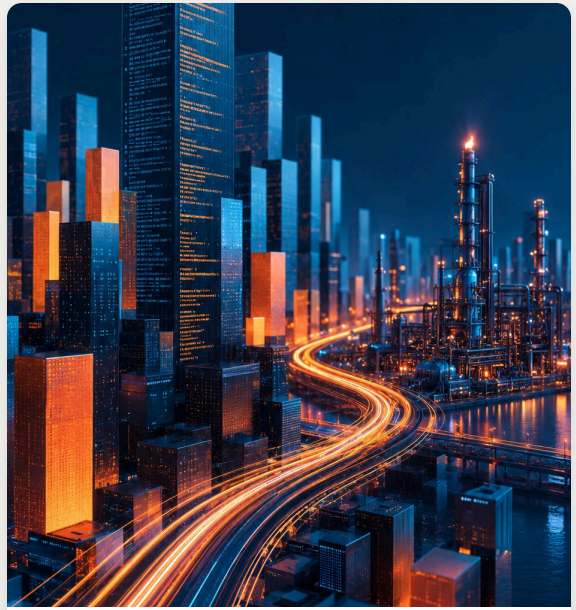

Practical automation, intelligent workflows and enterprise-grade AI — built for real results.

Membria.AI

AI Operating Environment

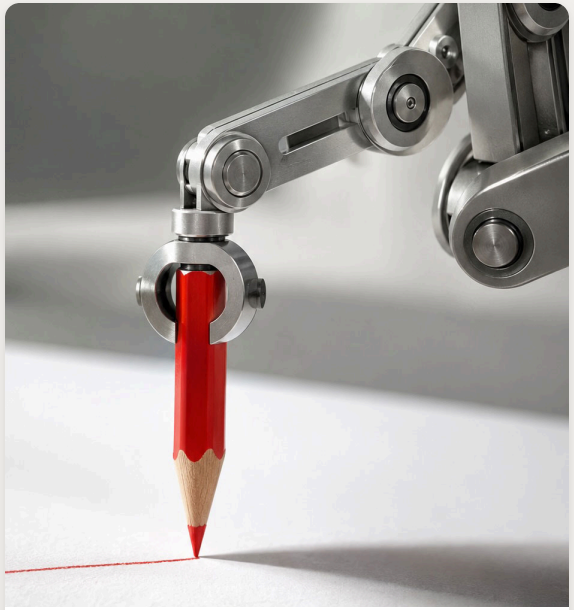

Our core product — agents, memory, knowledge and verification combined into one enterprise-ready AI platform.

Vertical Expertise

Code · Fintech · Government · Audit · EPC

We specialize in complex domains where AI needs precision, context and process understanding.

How We Work

Applied AI Engineering

We ship enterprise AI projects that stress-test and fund Membria's core — concept to production.

COMPANY PROFILE

Actiquest Labs at a Glance

Key facts, production footprint and enterprise AI capabilities.

10+ years enterprise product, AI engineering and venture-building

4 verticals — Fintech · Government · Audit · Engineering/EPC

100+ seats deployed across production AI use cases

METRIC	VALUE
Founded	February 2023 · California, USA
European Presence	Belgium entity · relocation to Luxembourg planned
Core Product	Membria.AI — memory & experience layer for AI agents
Production Verticals	SDLC · Fintech/Banking · AI Accounting/Audit · Engineering/EPC
Deployment	Cloud SaaS · self-hosted · on-premise enterprise
Clients & Partners	OES · Wowcube · Hiscox · K-Telco · Kazakhstan Government · industrial enterprises across EMEA/CIS
Technology Partners	NVIDIA · Amazon Web Services · LuxProvide
Team	core team of 4 · 20+ years enterprise software & audit · 9 years applied AI — finance, government, industrial, deep-tech

OPPORTUNITY

Why partner *with Membria*

1. **Agents became the workforce**
   Claude Code, Codex and Cursor do real daily work in code, engineering and finance — but they ship without memory. Membria adds it.

2. **One integration, every agent**
   MCP plugs a memory plane into any agent on the market — technology partners connect once instead of building per-vendor integrations.

3. **Sovereign & regulated by design**
   EU AI Act and ISO 19650 require defensible decisions and audit trails. Membria runs cloud, self-hosted or on-premise — a fit for sovereign and regulated infrastructure.

4. **Experience compounds with every partner**
   Nobody owns the decision → outcome graph yet. Every deployment strengthens the shared knowledge graph that all partners build on.

PRODUCT

Membria *Reasoning Graph* Workforce

INSTITUTIONAL KNOWLEDGE

Memory

- ✓ **Decisions** — every choice captured with its reasoning
- ✓ **Consistency** — behavior chains keep teams aligned
- ✓ **Skills** — wins distilled into reusable know-how
- ✓ **NegativeKnowledge** — failures become rules

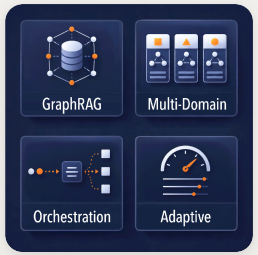

MULTI-AGENT HARNESS

Reasoning

- ✓ **Mesh** — many agents work in parallel
- ✓ **Coordination** — agents hand off via A2A
- ✓ **Routing** — each task to the right model
- ✓ **Quality gates** — verification blocks bad output

DOMAIN-AGNOSTIC FOUNDATION

Graph

- ✓ **GraphRAG** — semantic search over a property graph
- ✓ **Multi-domain** — one schema across every domain
- ✓ **Orchestration** — work runs as a dependency graph
- ✓ **Adaptive** — memory that strengthens with use

HOW IT WORKS

One loop, *every stage*

Not a memory bolted onto one step — every shipped outcome feeds the next decision.

01

Plan

Recalls decisions and outcomes from similar work — the agent starts from what already worked.

02

Execute

Injects validated skills and blocks known anti-patterns as the work is being done.

03

Review

Checks the result against past failures and standards — deterministic critics, auditable output.

04

Ship

Records the real outcome and links it back to the decision that caused it.

↻ **Every outcome feeds the next decision.** One MCP connection: `npx @membria/cli init`

WHY MEMBRIA?

Core Capabilities

The full stack — from memory and reasoning to deployment and governance

AI Agent Orchestration

Multi-agent BBS mesh, WorkGraph DAG, A2A protocol coordination

Causal Memory

Decision / Outcome / NegativeKnowledge graph with time-decay and compounding

Verification Engine

Cross-document consistency checks, rule-based normative validation, quality gates

Graph Intelligence

Memgraph property graph, symbol-level CodeGraph, policy graph with Hebbian co-activation

LLM Integration

Claude / GPT factory, structured output, behavior chains, context injection

Product Engineering

Full-stack: FastAPI + React + Node.js, MCP protocol, Telegram, Web Dashboard

Domain AI Systems

Vertical-specific schemas, critics, standards compliance (ISA / API / ASME / IEC)

Security & Governance

PolicyEngine, RBAC, OIDC/SSO, prompt injection defense, secrets management

Bottom line: Generic AI forgets. Membria remembers, reasons, and governs.

FOCUS

One core, *many domains*

Verticals are distribution of one product — not divergence. The same graph schema ships verbatim in every codebase.

PRODUCT	WHO BUYS	DELIVERY	STATUS
Membria CE	solo developers on Claude Code / Codex / Cursor	cloud SaaS · zero-install MCP	SAAS · CODE.MEMBRIA.AI
Membria Enterprise	engineering & product teams	self-hosted platform · own UI	DEMO · DESIGN PARTNERS
AI-EPC	EPC contractors & design institutes	vertical app on the same core	LIVE DEMO · EPC.MEMBRIA.AI
Glass	accounting & audit teams	vertical app on the same core	DESIGN-PARTNER STAGE

Proof of substrate: Decision · Outcome · NegativeKnowledge · Skill — one schema, one causal experience loop, shared verbatim across every codebase. A vertical competitor can't follow us across domains; we can.

PROJECTS

What we are *building*

Six projects on one memory core — from developer tools to regulated finance and public safety.

PROJECT	CUSTOMER / DOMAIN	WHAT WE BUILT	STATUS
Membria CE	solo developers · Claude Code, Codex, Cursor	experience layer for coding agents: decisions, outcomes and failures over one MCP endpoint	SAAS · LIVE
Membria CLI	engineering teams · inside the customer perimeter	SDLC harness: spec-to-release pipeline of agent roles with gates, policy and shared memory	DEMO · DESIGN PARTNERS
AI-EPC	EPC contractors & design institutes	tender to issued package across 17 engineering disciplines, checked against standards	LIVE DEMO
Crypto broker platform	licensed virtual-asset broker · Central Asia	data bus and decision memory between the execution and compliance tracks	IN BUILD · DEV STAND
Bank automation	developer-owned bank	regulatory reporting, mortgage pipeline and escrow assistants	PILOT PROPOSAL
C2 Center AI	government emergency response	early warning and zone access control with human approval, on-premise	TARGET WORKFLOW

Honest status: CE is live, the others range from demo and development to target workflows. Client names are withheld; each case marks what is built and what is target.

CASE STUDY · 01

Membria CE *learns from reverts*

Solo developers · Claude Code, Codex, Cursor · live SaaS

1. **Challenge**
   Coding agents start every session from zero. A fix reverted two weeks ago is proposed again, because the lesson lives in an old transcript, not in memory.

2. **What we built**
   An experience layer beside any harness, connected through one MCP endpoint. It records each decision with its alternatives and confidence, and attaches outcomes from git reverts, CI and merged PRs.

3. **Result**
   Failures become warnings before the next similar choice, and confidence is calibrated per domain. A read-only commons from real repositories means day one is not empty.

96.5K

~570K
Skills + AntiPatterns live

1
command to connect

Stack & partners: MCP · Claude Code · Codex · Cursor · cloud SaaS or self-hosted · code.membria.ai

CASE STUDY · 02

Membria CLI *agents as one team*

Engineering teams · small team or inside the customer perimeter · demo with design partners

1. **Challenge**

   Per-seat agents speed up individuals and slow down teams: no shared process, no shared memory, and no way to say which agent did what under whose approval.

2. **What we built**

   A team SDLC harness: spec, design, plan, code, test, docs, review, release — run by agent roles on a shared graph, with hard quality gates, policy, approvals and audit.

3. **Result**

   Every decision and outcome is recorded; a revert marks a decision failed for every engineer and agent. Any model per role, with the team graph kept in the customer perimeter.

8

pipeline phases, spec to release

5

agent roles incl. a blocking gate

2

run modes: team and enterprise

Stack & partners: MCP · OIDC / SSO · OPA · any LLM provider · self-hosted or inside the perimeter

CASE STUDY · 03

AI-EPC *from tender to issue*

EPC contractors & design institutes · live demo · the full flow below is the target state

1. Challenge

A tender arrives as a folder of specs, drawings and catalogues. Requirements get missed, disciplines drift apart, and a late clause becomes rework — 28% of budget overruns.

2. What we built

Reads the tender into a cited requirements register, then builds the engineering level by level. Models propose; rules, codes and catalogues accept or reject. Every value has a source or a recorded decision.

3. Result

A consistent package per the contracted register, with an evidence trail behind each document. Engineers approve at every gate; the system never stamps or certifies.

17

engineering disciplines in scope

20,000+

standards processed into the graph

5

approval gates, G0 to G4

Stack & partners: DXF · DEXPI · IFC · ISO / IEC / ASME / API / GOST · on-premise or cloud · epc.membria.ai

CASE STUDY · 04

Crypto broker *one data bus*

Licensed virtual-asset broker · Central Asia · client anonymised · dev stand

1. **Challenge**

   Two vendors build execution and compliance in parallel with no shared contract. Nobody can say why a transaction was blocked, and personal data must stay out of shared systems.

2. **What we built**

   Membria owns the data bus and decision memory: a Kafka backbone with a catalog of 38 event types, schema-validated and replayable, and a graph of 42 object types. No personal-data profiles are stored.

3. **Result**

   Both vendors integrate against one documented contract. Compliance asks in plain language why an operation was blocked and gets the chain with its source events; encrypted backups are restore-tested automatically.

38

event types on one bus

376

automated tests passing

~6 wks

first full cycle, dev stand

Stack & partners: Kafka · Memgraph · Qdrant · FastAPI · Python · Membria Memory Contract API

CASE STUDY · 05

Bank pilot *reporting & mortgage*

Developer-owned bank · regulatory reporting, mortgage and escrow · pilot proposal

1. **Challenge**

   Dense regulation and repetitive expert work: central-bank report specs take 2–5 business days, mortgage review is a 40+ field manual checklist, escrow specs are copied per project.

2. **What we built**

   A three-phase pilot on the bank's own LLM choice: a reporting assistant, a mortgage pipeline assistant, then ecosystem intelligence. Graphs hold the object model, regulatory forms and escrow rules; skills keep mappings that worked.

3. **Result**

   Targets: report specification from 2–5 days to 1–4 hours, mortgage cycle from days to hours for standard cases, and regulatory changes traced to every affected spec.

1–4 h

target spec preparation time

3

pilot phases, about 20 weeks

4

domain graphs: model, regulatory, compliance, escrow

Stack & partners: Graph memory · Claude / GigaChat / on-prem Qwen · web, Telegram and CLI

CASE STUDY · 06

C2 Center *decisions in minutes*

Government emergency response · on-premise · target workflows, not yet implemented

1. **Challenge**

   In a flood and landslide zone, surveys, sensors and history sit in separate systems. The duty officer needs a risk alert with sources, and closed roads need enforcement without a personal-data registry.

2. **What we built**

   Five AI agents (Duty, Planner, Routes, Notification, Analyst) work over a knowledge graph; humans decide and nothing runs without approval. Edge-AI cameras send events, not video.

3. **Result**

   A decision-ready recommendation within minutes, a full audit trail and all processing on-premise. Closure enforcement with human oversight and no vehicle-owner registry.

5

AI agents, humans decide

100%

on-premise processing

0

personal-data registries

Stack & partners: LiDAR · IoT sensors · MQTT with mutual TLS · edge-AI cameras · integrator-dependent

TEAM

[2–3 sentences: background, years of experience, what Michael owns at Membria.]

Focus: platform architecture, enterprise delivery
Previously: [companies / projects]

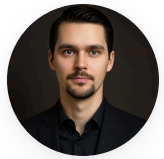

Philippe Khomenok

COO · CO-FOUNDER

[2–3 sentences: background, years of experience, what Philippe owns at Membria.]

Focus: strategic vision, go-to-market and growth
Previously: [companies / projects]

Mike Keer

CTO

[2–3 sentences: background, years of experience, what Mike owns at Membria.]

Focus: memory & reasoning systems — fast, reliable, built to scale
Previously: [companies / projects]

Mayya Aprosina

UI/UX

[2–3 sentences: background, years of experience, what Mayya owns at Membria.]

Focus: product design across CE, EPC and Code surfaces
Previously: [companies / projects]

PARTNERSHIP MODELS

Technology *& infrastructure*

Two partner tracks — pick one or combine them.

Technology

Agent & developer platforms

Agent, IDE and workflow platforms embed Membria memory through MCP and A2A — your users get persistent, auditable experience out of the box.

Technology

AI, data & tooling vendors

Connect your models, data pipelines or engineering tools to the shared knowledge graph: memory, verification and standards as a service inside your product.

Infrastructure

Cloud & HPC providers

Host Membria for sovereign, self-hosted and on-premise deployments — with a joint route to enterprise and public-sector buyers.

Infrastructure

GPU & hardware vendors

Co-optimise graph and inference workloads for your platform and publish reference deployments for AI-agent memory at scale.

Flexible by design: commercial terms are agreed per partner. Start with a pilot, scale what works.

MOAT

Three EMPIRIA graphs, *day one*

Cold start is the hardest problem in agent memory. We don't have one — every vertical ships with a pre-loaded PK/NK library before a single client session runs.

VERTICAL	PK — BEST PRACTICES	NK — ANTI-PATTERNS / PROHIBITIONS	SOURCE	STATUS
Engineering (EPC)	**~1.3M**	**~1.2M**	20,000+ standards — ISO · IEC · ASTM · ГОСТ · API · ASME · NFPA · DNV	LIVE · SCALING · EPC.MEMBRIA.AI
Code	**~250K Skills**	**~320K AntiPatterns**	96.5K mined repos + curated sources, CWE-mapped	LIVE · SCALING · CODE.MEMBRIA.AI
Audit / Glass	**schema live**	**schema live**	materiality & provenance graph — seeding from client engagements	DESIGN-PARTNER STAGE

Same schema, same loop, three domains. A generic memory startup starts every client at zero. We start every client already knowing what fails.

HOW WE START

From first call *to co-launch*

A short, low-risk path — you see the value before committing.

01

Align

Share your platform or infrastructure and the customers you serve; we map where memory, verification or knowledge add value.

02

Pilot

Connect with one command and run a scoped pilot on your own stack, with our engineers alongside.

03

Integrate

Embed Membria or deploy it on your infrastructure; agree deployment model, support and security review.

04

Co-launch

Go to market together: reference deployments, joint case studies and a shared pipeline.

Start in minutes: `npx @membria/cli init` — then talk to us at **hi@actiq.ai**

Let's build the layer
agents can't work without.
